

# Running maven

Jacob Riesen

March 9, 2020

## 1 Install maven

In order for maven to run you need to install it on your computer. I used homebrew install to download my copy.

## 2 Running maven.

The the following terminal commands should be run in the terminal where the current directory is the folder containing the pom.xml

### 2.1 compiling for the first time.

```
mvn clean install
```

### 2.2 Running the project

```
mvn exec:java
```

### 2.3 Running the tests.

```
mvn test
```
